

Xrypt Trading Service - One-Page Summary

What it is

Xrypt is an AI-powered trading signal generator that uses inverse learning from trader losses to identify profitable patterns and continuously improve. It also supports DEX trading execution across multiple chains.

Who it is for

Crypto traders who want AI-generated signals with optional on-chain DEX execution.

What it does

- Generates AI trading signals with confidence scores and risk levels.
- Learns from trader losses and multiple data sources to improve accuracy over time.
- Collects public market data and trader submissions for continuous learning.
- Integrates DEX trading and multi-chain support (Ethereum, BSC, Arbitrum, Polygon).
- Enables Web3 wallet connections for on-chain trade execution.
- Exposes REST and WebSocket endpoints for signals, feedback, and notifications.

How it works

- Frontend provides a signals UI (signals.html) and Web3 trading interface.
- Backend runs an Express server with REST APIs, WebSocket updates, and DEX endpoints.
- AI engine (HybridEngine) combines public market data with trader data patterns.
- Data collection layer pulls exchange data plus trader submissions and feedback.
- Blockchain layer executes on Uniswap V3, PancakeSwap, and QuickSwap.

How to run

1. Install dependencies: `npm install`
2. Create environment file: `cp .env.example .env` (then edit values)
3. Configure RPC endpoints: `./scripts/setupRPCConfig.sh`
4. Bootstrap the AI engine: `npm run bootstrap`
5. Start the server: `npm start` (open <http://localhost:3000/signals.html>)
